

You think you may have been infected with HIV?

PEP can prevent the infection

PEP is an emergency measure taken after being exposed to HIV. It consists of taking medication for 28 days that can block the reproduction of the virus in the body.

ACT WITHIN
24-48h

The earlier the better! You must start the treatment in the hours following the sexual encounter that you believe has put you at risk of contracting HIV.

Consult the RÉZO website to know more about PEP
(costs, access, effectiveness, side effects, etc.)
